

Software Requirement Specification (SRS)

E-Commerce Order Management Database System

1. Introduction

The E-Commerce Order Management Database System is used to manage customers, products, orders, payments, shipments, and reviews. It stores all data in a centralized database for easy management.

2. Purpose

The purpose of the system is to:

- Store customer and product information.
- Process customer orders.
- Manage payments and shipments.
- Reduce data redundancy.
- Generate business reports.

3. Scope

The system includes:

- Customer Management
- Product Management
- Category Management
- Supplier Management
- Order Processing
- Payment Management
- Shipment Tracking
- **Customer Reviews**

4. Functional Requirements

- Register customers.
- Add, update, and delete products.
- Manage product categories.
- Place customer orders.
- Record payments.
- Track shipments.
- Store customer reviews.
- Generate reports.

5. Non-Functional Requirements

- Easy to use.
- Secure user data.
- Fast system performance.
- Reliable database.
- Regular data backup.

6. Core Entities

- Customer
- Category
- Product
- Supplier
- Order
- Order Details
- Payment
- Shipment
- Review

7. Assumptions

- Every customer has a unique ID.
- Every order belongs to one customer.
- Every product belongs to one category.
- Payments are linked to orders.

8. Constraints

- Only the given entities are used.
- Data is stored in a MySQL database.
- Internet connection is required.

9. Conclusion

This system helps manage e-commerce operations efficiently by organizing customer, product, order, payment, shipment, and review information in a centralized database.

This version is about 1–2 pages in Microsoft Word, making it simple and suitable for a Week 1 submission.
